TITLE: workshop registration & confirmation app

GITHUB LINK : <https://github.com/aishupapa2316-sketch/TNCDS-FWD-DPI.git>

1. ABSTRACT

The Workshop Registration & Confirmation App is a web-based application developed to help institutions manage workshop registrations digitally. Normally, institutions collect participant details manually, which may cause duplicate entries and data loss. This project allows users to register for workshops, stores participant information securely, generates confirmation messages, and prevents duplicate registrations. It makes workshop management easier and faster.

2. PROBLEM STATEMEN

Traditional workshop registration systems have several issues:

Manual entry consumes more time

Duplicate registrations may happen

Participant records may be lost

Sending confirmation manually takes effort

Difficult to manage large numbers of registrations

A computerized system is needed for efficient management.

3. OBJECTIVES

Main objectives of this project:

Create online registration form

Store participant details

Prevent duplicate registrations

Generate confirmation message

Manage participant list easily

Reduce manual paperwork

4. PROJECT SCOPE

Users can register for workshops easily through online form

Duplicate registrations can be avoided

Participant details can be stored safely

Confirmation message is shown automatically

Colleges and institutions can use this system

In future, database and email confirmation can be added

5. TECHNOLOGIES USED

Technology

Purpose

HTML

Web page structure

CSS

Styling and design

JavaScript

Functional logic

Local Storage

Save registration data

github.com ☐

Project hosting

6. APPLICATION FLOW

System flow:

Start

↓

User enters registration details

↓

System validates details

↓

Check duplicate registration

↓

Store participant data

↓

Generate confirmation message

↓

Display participant list

↓

End

Modules:

Registration Form Module

Validation Module

Duplicate Check Module

Confirmation Module

7. KEY REACT CONCEPTS USED

Components – Used to create registration form and display sections

State Management (useState) – Used to store user input and registration details

Event Handling – Used for button click and form submission

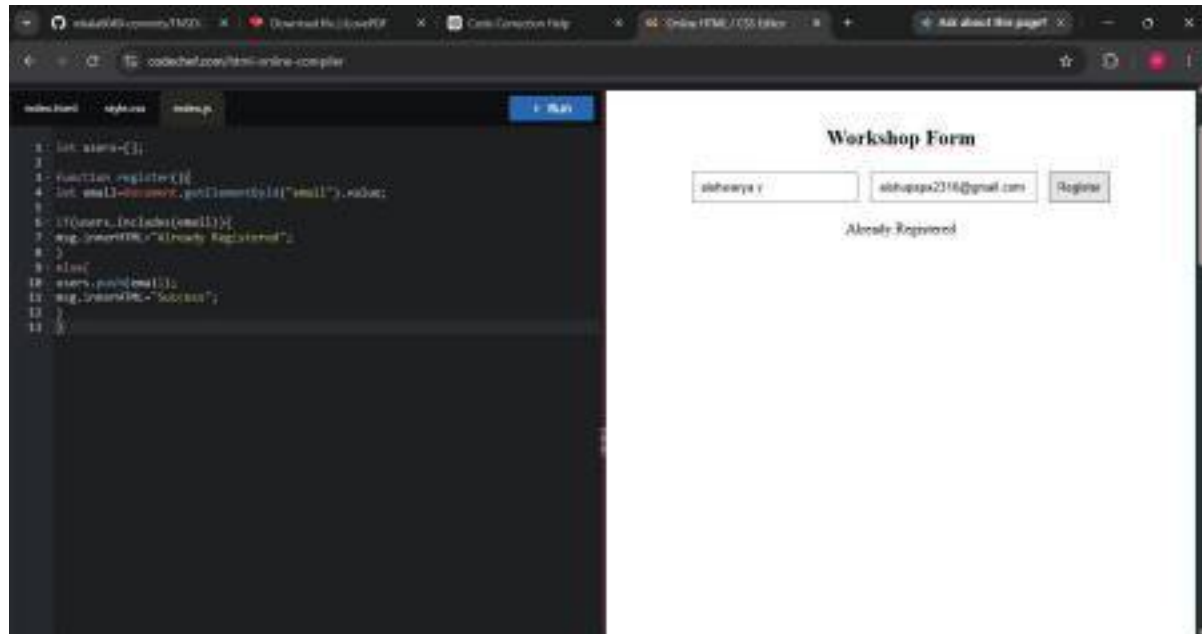

Conditional Rendering – Used to show success message or duplicate registration message

Props – Used to pass data between components

Form Handling – Used to collect name and email details from users

8. EXPECTED OUTPUT

[illegible]

9. CHALLENGES FACED

Handling duplicate registration checking was difficult

Managing user input validation required extra logic

Displaying confirmation message correctly took testing

Designing a simple and user-friendly interface was challenging

Storing participant data without errors needed careful coding

10. LEARNING OUTCOMES

Learned how to create a web-based application

Understood form handling and user input validation

Learned how to store and manage data using JavaScript

Improved knowledge in HTML, CSS, and JavaScript

Gained experience in developing real-time mini project

11. CONCLUSION

The Workshop Registration & Confirmation App helps institutions manage workshop registrations digitally and efficiently. It reduces manual effort, avoids duplicate registrations, and improves participant management. This project provides a simple and reliable solution for handling workshop events.
